PRELIMINARY REPORT

EASTERN GRID SURVEY NO. 12

(Eastern Area Cruise No. 22)

25 August - 5 September 1967

Prepared by

Robert DeLong

EAC 22
EGS 12

Support Vessels :	LT 2080 & 2085		25 - 29 August
	Granville S. Hall, YAG 40		29 Aug. - 5 Sept.
Personnel:	Robert L. DeLong (BIC), Richard D. Chandler, Gerald A. Sanger		
Itinerary:	25 August	0800	LT's depart Long Beach - Chandler, Sanger
	25 August	1520-1900	Offshore survey of south coasts, Anacapa, Santa Cruz, and Santa Rosa Islands. Chandler and Sanger. Results included in EAC 23 report
	26-29 August		LT's run Grid from Point ASL & Elm
	28 August	1600	YAG 40 depart Long Beach - DeLong
	29 August	0745	Transfer Chandler & Sanger to YAG 40
	29 August	1120	Re-enter Grid at Point Elm
	4 September	0915	Depart Grid, Point Oak
	5 September	1400	Arrive San Diego

The much-appreciated, excellent cooperation continues to be extended by officers and men of the Granville S. Hall. Fine cooperation was also received from the officers and crews of the LT's.

The departure of the YAG 40 from Long Beach was delayed due to a breakdown in after-steering. The LT's were used for the first third of the Grid survey to prevent disruption of the fall schedule. Seas were small during this first period, providing good observing conditions from the tugs. En route to the Grid the LT made an offshore survey of the south sides of Anacapa, Santa Cruz, and Santa Rosa islands.

During the in-port period in Long Beach a Bathythermograph winch was acquired and installed on the YAG 40. The winch was most generously loaned to us by Scripps Institution of Oceanography for the duration of the work.

Methods

Complete diurnal observations were taken while in the Grid area. Nocturnal observations were taken 29 August through 3 September, both while underway and while laying to. During the 2-1/2 hours of laying-to on 31 August a floating mist net was successfully launched from the ship. During this same period the boat launching platform was lowered and unsuccessful attempts were made to collect cephalopods.

The skiff was used 2 and 3 September for collecting birds while in the southern portion of the Grid. Attempts were made to collect specimens of Delphinus from the skiff as well as from the ship.

Bathythermograph casts were made at four-hour intervals in the central and southern portions of the Grid. For reference the BT slides were photographed individually against the calibrated Grid and printed on 8 x 10 contact sheets. A copy of these prints is included with this report as Figure 3.

All positions on this survey and on EGS 10 and 11 are LORAN fixes. LORAN accuracy on the first third northern leg is poor. All other fixes are considered accurate within the limits of LORAN (2 to 5 miles).

Results of Discussion

During diurnal observations from the tugs and YAG of 109.1 hours and 957 miles 452 birds were recorded. These observations are summarized in Table 1. The observations from the two vessels are treated equally. No discussion of the validity of such treatment is undertaken at this time. Nocturnal observations are summarized in Table 3.

Again on this survey diurnal coverage was good in each of the nine sectors of the Grid. Numerical abundance and densities of species groups are included in Tables 4 and 5. North-South and East-West sectional breakdowns are Tables 6 and 7. About 46 percent of the observations were recorded in the northern third of the Grid. A near-equal percentage of observations was recorded in the eastern third. The previously recorded northward movement of storm petrels and their concentrations around Point Dogwood during EGS 10 and Point Ash on EGS 11, plus the presence of most of the phalaropes recorded in the northern and eastern sections strongly suggests the presence of "richer" waters in the northern third of the Grid. The same is generally true of the eastern third of the Grid. The cause for this is believed (without concrete evidence at this time) to be that both of these areas lie in more active areas, i.e., faster flowing, of the California Current. The faster currents affect the north section of the area, then around Point Conception and shift eastward. It then asserts strong influence only on the eastern third of the area. If this rambling hypothesis be correct it would explain bird abundance on the basis of environment rather than by proximity to land masses (which seams a weak explanation for distribution of many recorded pelagic seabirds).

The recorded abundance of Storm Petrels in the southwest section (sector 7) of the Grid is not valid. On 2 September the skiff was used for four hours; during this time 47 percent of the day's total was recorded. This was effected as follows: The seas were calm, increasing the radius of visibility by possibly 2K; the ship was running at 7K, allowing the skiff to work up to 2+ miles on each side of the ship - this again increasing the radius of observation. As all birds seen from the skiff were radioed to the ship and recorded there, it effectively increased the number of birds recorded by two to four times. No effort was made to adjust these data in the presentation as this is difficult to achieve with statistical significance.

Ten Storm Petrels, one Red Phalarope, and one Cook's Petrel were collected in seven hours of skiff operation on two separate days.

Bathythermograph data collected on this trip promise to yield significant environmental data, but at this time we have not analyzed these data.

Efforts to collect birds with floating mist nets were unproductive. Possibly given a smaller ship, i.e., less free board thus easier to work from, this technique could be productive; however, a single net set in the sea is a very small sampling device and appears rather insignificant. Attempts to dip-net squid on the one night failed. There were squid in the waters but they remained at depths beyond the range of the dip-net. This is however a proven method of cephalopod collecting and warrants further efforts.

One of the abberant Delphinus was collected from the tugs. Full measurements and photos were taken of this animal. All attempts to collect these animals from the YAG again failed. This animal was very abundant in the Grid during this survey (See SA Manuals). Larger cetaceans were found only in the north and central portions of the Grid.

Black-footed Albatross

Distribution of albatross appears random. The birds showed little inclination to follow the tugs used on the northern legs of the survey. The presence of largely white-faced birds with light-appearing breast and belly feathers was noted.

Pink-footed Shearwater

Two birds were recorded in the northeast section and one in the north-central section of the Grid.

New Zealand (Buller's) Shearwater

One bird was positively identified in the northwest section of the Grid.

Sooty Shearwater

Three birds were recorded in the north and central sections of the Grid. This species is still in low numbers outside the Grid area.

Cook's Petrel

Three birds recorded and one collected. These birds apparently represent stragglers of the mass movements recorded during EGS 10.

Storm Petrels

WRSP	94
DRSP	15
Storm Petrel sp.	90

All birds observed, with one exception, are believed to be Leach's-type Storm Petrels; the exception being a small, all-dark bird observed on 31 August at 32°30' N, 123°19' W. This bird represents the first possible record of a Leach Petrel (Halocyptena microsoma) in the Grid.

The distribution of storm petrels during the survey did not appear random. Densities were high in the north and southern sections of the Grid. Density in the central section appears low; however, these data may be misleading. Seas were choppy during the survey of the central portion and generally smooth during the survey on the northern and southerly sections of the Grid. It is possible that sea conditions such as encountered in the central section reduce the radius of visibility enough to explain the low numbers recorded. It is well known among field observers that storm petrels are difficult to see in choppy seas (6-8 ft.), but it is not possible to assign a quantitative adjustment factor to these data to account for environment changes.

The high linear density of storm petrels in sector 7 is discussed earlier in the report. In summary of that discussion the recorded density is higher than actual densities due to smooth seas and observations from the skiff. Both factors increased the radius of visibility yielding greater numbers of birds recorded.

Red-billed Tropicbird

Two birds were recorded in sector 9 of the Grid.

Red Phalarope

Sixty-nine percent of the phalaropes were recorded in the northern section of the Grid. Birds were again recorded in the vicinity of slicks believed to be indicative of oceanographic fronts. These slicks were found in the east side of sector 2, as was the case on EGS 11.

The nocturnal abundance of phalaropes in the central section is of interest. On the night of 3 August, after seeing no phalaropes during the day, ca. 25 birds were recorded during 2-1/2 hours of nocturnal observation. The birds are attracted to the ship at night given proper overcast conditions. But on this night the ship was drifting (essentially remaining in one area) and such high numbers are difficult to explain. Do the birds move primarily at night and stay on the water during the day, or is there another explanation?

Jaegers

Parasitic Jaeger	1
Long-tailed Jaeger	1
Jaeger sp.	21

Jaegers were also centered in the northern section of the Grid, where 83 percent of the birds were recorded. Specific identification of these birds remains a problem as they seldom come close to the ship.

Alcids

Xantus Murrelet	1
Cassin Auklet	2
Alcid sp.	5

These five birds were recorded in the north and central sectors of the Grid, i.e., sectors 3 and 6.

Sterna sp.

Six unidentified birds were recorded in sectors 3 and 6.

Gull sp.

Four birds were recorded - not to species - in sectors 2 and 3.

Accidentals

Ducks sp.

Twenty-five birds recorded in two flocks in sectors 2 and 5.

Mourning Dove

+ - present
0 - absent

0	0	0
0	+	+
0	+	+

Seven Mourning Doves were recorded in sectors indicated above. Collected.

Band-tailed Pigeon

Records - 2 in sectors 5 and 9.

Brown-headed Cowbird

One bird seen each in sectors 4 and 8.

Bullock's Oriole

One bird landed on the main mast on 30 August while in sector 4. It was shot but fell in the water and was lost.

Mammals

Nine hundred thirty-nine mammals recorded in the Grid area (all but two were Cetacea).

Dolphins

This was the most abundant mammal in the Grid area with a total of 677 individuals recorded. One specimen was obtained 27 August at 34°20' N, 126°27' W. Complete measurements and photos were taken of this animal, and the skeleton roughed out and saved.

Great variance in coloration of extremities has been noted during past surveys. During this survey the animals recorded had small amounts of "dirty white" in the dorsal and on the flippers, whereas those seen and photographed on earlier cruises had brilliant white markings. The explanation of the change is believed to be one of two factors: 1) The mammals recorded in the area earlier have moved out of the Grid area, probably north or northwest, and those recorded on this survey were arrivals of another population (probably southern as northerly movements are evident); or 2) The white coloration is a secondary sexual characteristic which is becoming poorly defined in the "nonbreeding seasons." We have had extensive correspondence with Cetalogists on the West Coast and none can offer an explanation to this problem.

Lissodelphus

The appearance of this animal in the northern section of the Grid suggests that the southerly movements of the species are beginning.

Orcinus

A pod of 25± "killers" was seen at 34°53' N, 123°19' W. Loosely associated with this pod were two animals which showed large amounts of albinism. The animals were chased for some time and well-observed. Photos were taken by tug crewmembers and hopefully will be of value.

Whales

Baleen whales still predominated in the area. The concentration of all whales was in the northern section of the Grid area. That the largest of the Balaenoptera are remaining in the area indicates relatively large planktonic concentrations in these northern waters. These large animals would leave unrich waters to seek food were it not abundant here.

Non-Grid

Observations are summarized in Table 8. The presence of large numbers of Sterna just outside the Grid near Point Ash is worthy of mention. All other interpretations are left to the reader if he will refer to Tables.

MARINE MAMMAL OBSERVATIONS - EAC 22
25 August - 5 September 1967

GRID

Identification	#	Latitude	Longitude	Time	Date	Remarks
Dall Porpoise	2	34°57' N	121°27' W	0635	26	Riding Bow
Right Whale Dolphin	150±	34°59' N	122°17' W	1115	26	Chased (tugs)
Right Whale Dolphin	50±	34°58' N	122°2' W	1230	26	Same as above ? Chased briefly
Seal sp.	1	34°56' N	122°45' W	1450	26	NE Eared, DK BR, 5'-6' long
Whale	1	34°54' N	123°07' W	1705	26	Humpy-Rel #2 "icecream cone"- 20' showed flukes and lots of back, a good splash too. Close, 1/3 mi. but only glimpsed.
Delphinus	75	34°53' N	123°16' W	1745	26	Chased into sun for 5 min. - did not follow ship; high dorsal, some appeared to have white in dorsal; others ?
Orcinus orca	25±	34°53' N	123°19' W	1815	26	2 "pure" albino, 1 [2?] mottled albino
Porpoise	25±	34°53'N	123° 19' W	1815	26	Delphinus ? With killers
Porpoise	20±	34°53' N	123°31' W	1932	26	Dall or Delphinus not chased. "Throwing themselves bodily thru the H_2O."
Delphinus	50±	34°20' N	126°27' W	1320	27	1 ♂ collected
Porpoise sp.	15±	34°12' N	126°18' W	1500	27	Glimpsed astern, half twists, may be Delphinus, not chased
Delphinus ?	50±	34°12' N	125°55' W	1705	27	4 mi. to port Delphinus-acting; not chased
Sperm Whale	1	34°12' N	125°36' W	1857	27	1 animal, many blows
Baleen Whale	1+	34°14' N	123°25' W	0658	28	W; far to port/S pout seen
Whale sp.	1	34°14' N	123°26'W	0705	28	ca. 4-5 mi. off stbd beam
Porpoise	30±	34°14' N	123°05'W	0907	28	Delphinus ? Not chased; high dorsal-type with much splashing; running hard
Seal sp.	1	34°13' N	122°57' W	0953	28	Head out of H_2O

Identification	#	Latitude	Longitude	Time	Date	Remarks
Baleen Whale				1155	28	60'
Delphinus	30±	34°13'N	122°38' W	1205	28	At least 1 w/white-type dorsal, did not ride bow, chased and fled
Sei.? Whale	2	34°12' N	122°20' W	1615	28	Ident. on basis of large dorsal
Baleen Whale	1	34°11' N	122°02' W	1648	28	No prominent blowhole or dorsal
FIN ? Whale	1	34°11' N	121°56' W	1735	28	3 Blows High, back seen
Delphinus	8	34°11' N	121°46' W	1845	28	Attracted to ship; rode off fantail, not jumping
Sperm Whale	1+	33°18' N	121°36' N	1323	29	Blow still angular against wind. very low when blowing down wind
Baleen Whale	1	33°17' N	121°48' W	1350	29	2 blows; high columnar, back bit mp dprsa;s seem
SEI (???) Whale	1+	33°17' N	121°57' W	1445	29	Small columnar blows
Sperm (?) Whale	1	33°16'N	122°03' W	1518	29	blows, being windswept
Baleen Whale	1	33°15' N	122°06' W	1537	29	Blue/SEI ?? No dorsal seen
Delphinus	60±	32°40' N	126°28' W	1845	30	Riding bow wide variation in color patterns (See logs)
Delphinus	9±	31°41' N	121°16' W	1100	1	At least 2 w/white in dorsal; one small animal
Delphinus	60±	31°38' N	125°27' W	1400	2	Chased w/skiff
Delphinus (?)	5+	31°33' N	125°59' W	1830	2	Distant; not jumping
Delphinus	150±	30°56' N	124°14' W	1320	3	30 came to bow; many had white markings on dorsal - majority w/little white (see log
Delphinus	20±	30°55' N	123°49' W	1535	3	No white in dorsal
Delphinus	60	30°55' N	123°37' W	1645	3	No white in dorsal; ; 3 small animals behind
Delphinus	30±	30°54' N	123°29' W	1750	3	
			NON-GRID			
Delphinus	4	32°37' N	118°00' W	0700	5	Rode bow for 4 min. 1 w/light in middle of dorsal
